Case Study

Received 21st September 2011

Accepted 15th December 2011

Online Ready 28th February 2012

ABSTRACT

Traditional knowledge is common and important among the tribal people but much of the information is empirical at best lacking logical validation. A number of ethnic communities residing in the study area are partially or fully dependent on the forest resources to meet their requirements. Plants have traditionally been used as a source of medicine in Cameroon since early times for the control of various ailments afflicting humans and their domestic animals. However, little work has been made in the past to properly document and promote that knowledge. Today medicinal plants and the associated knowledge in the country are threatened due to deforestation, environmental degradation and acculturation. The present study analyses traditional knowledge and utilization of 94 species belonging to 84 genera under 46 families in day-to-day life of ethnic communities in Douala region, Cameroon. The diverse ethnic communities such as Bamiléké, Bassa, Béti, Haoussa, Douala, Bakoko, Bassolo, Ngumba, Dibom, Baya and Banen have a good association with plants and their potential role they use for different purposes and treatment of various ailments. The traditional knowledge on the utilization of these plants is widely accepted by the ethnic communities.

Keywords: Traditional; knowledge; Douala; medicinal plants.

1. INTRODUCTION

The use of plants as medicine is widespread throughout the world. The plant and plant products have augmented human culture since time immemorial. But few people realize that plant species are an important part of our environment (Singh, 1993). Traditional medicine practices and informations play an important role in the scientific research, particularly when the literature and fieldwork data have been properly evaluated. The documentation of traditional knowledge on the utilization of local plant resources by different ethnic groups or communities is one of the main objectives of ethnobotanical and ethnopharmacological researches (Shrestha, 1998). In general, traditional knowledge study focuses on the indigenous people. Indigenous people are the ones who were the original inhabitants of any place and live a life of their own which is of self-sufficient type with no foreign involvement. Indigenous knowledge systems are not only for the cultures from which they evolve, but also for scientists and planners striving to improve conditions in rural societies (Shengji, 1999). The rural people have developed unique indigenous knowledge related to the uses of plant resources due to constant association with the forests. This existing valuable information is needed to be documented before lost or disappeared. As there is lack of the documentation system in Cameroon, priority should be given to develop an ethnopharmacological uses and traditional knowledge of the medicinal plant species. Ethnic communities have immense knowledge which they pass on from generation to generation just through oral conservation (Rao and Shanpru, 1981; Chhetri, 1994). Traditional medicine knowledge of medicinal plants and their use by ethnic communities are not only useful for conservation of cultural traditions and biodiversity but also for community healthcare and drug development in the present and future. Herbal medicines have good values in treating many diseases including infectious diseases, hypertension, that they can save lives of many, particularly in the developing countries, is undisputable. Traditional knowledge is relatively new field of study in Cameroon, as it is in many other developing countries. He has taken his way of development, depending on local traditions. It is known that the way of administration to cure diseases using a particular plant widely differs among the indigenous people (Manandhar, 1994; Shrestha and Dhillon, 2003).

The present study, therefore aimed to investigate and document the oral heritage of traditional knowledge of the ethnic communities in Douala.

2. MATERIALS AND METHODS

2.1 Study Area

Cameroon is a multiethnic and multilingual country. There are more than ten different ethnic groups in Douala. The region of Douala lies between 03°40'-04°11' N latitude, 09°16'-09°52' E longitude ; is one of the 10 regions of Douala. The height ranges from 13 m. The city has a climate that belongs to equatorial area said Cameroonian characterized by two seasons with a long rainy season (at least 9 months), heavy rainfall (about 4000 mm per year), high temperatures (26.7°C) and stable. The average minimum temperature in Douala to 30 years (1961-1990) is 22.6°C in July and the average maximum temperature is 32.3°C in February. The relative humidity of the air remains high throughout the year and close to 100 % (Din et al., 2008). It has been found that various traditional knowledge systems are being practiced and followed by since long by the inhabitants of different areas of Douala region (Fig.1).

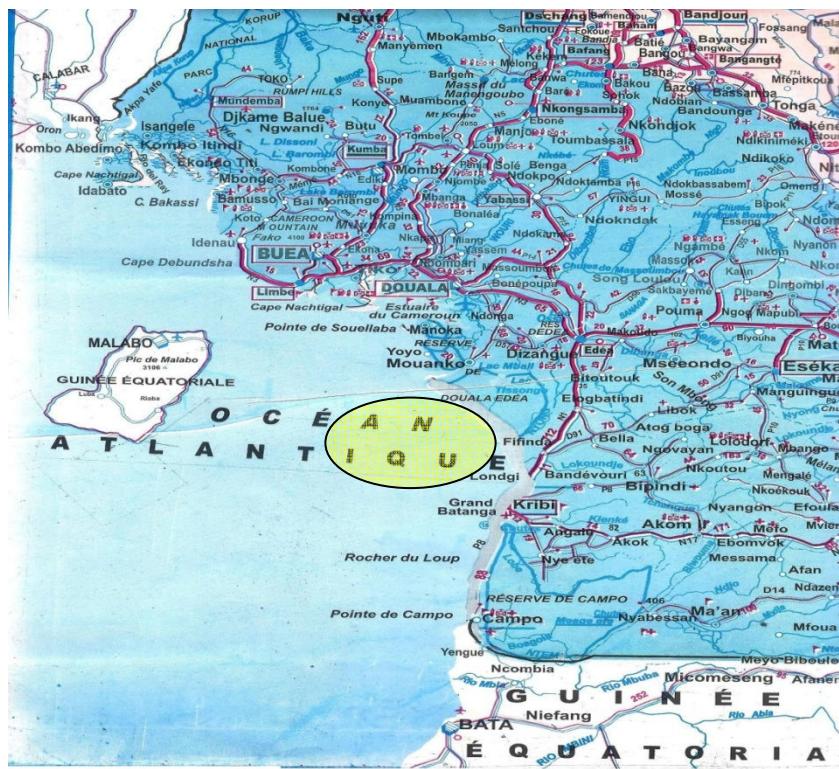

Fig. 1. Douala, study area (1:500.000)

2.2 Methodology

The present study was conducted during 2009 to 2010 covering different village development families of the Douala region. During the 75 household visits, traditional informations about medicinal plants were gathered through oral interviews and discussion with knowledgeable persons of the ethnic community. Interested persons are adults with at least forty over. The information gathered concerning the plants used to treat diseases. Only species for which the virtues are known were selected. Voucher specimens were collected from the field during the flowering and fruiting periods and biological type and habitat were confirmed. While noting information, every care was taken to record the local names of the plants, parts used, method of drug preparation and dosage uses. The specimens were also identified with the help of local floras. Herbarium specimens will be lodged in the Department of Pharmaceutical Sciences, University of Douala.

3. RESULTS AND DISCUSSION

3.1 Results

The results show that 75 households were surveyed and provided 521 citations of medicinal plants. The number of citations per household ranged from 1 to 28 with an average of 6.95. The 75 households are divided into 11 ethnic groups (Bamiléké, Bassa, Béti, Haoussa, Douala, Bakoko, Bassolo, Ngumba, Dibom, Baya and Banen) including the Bamiléké tribe is the most representative. The 521 citations were identified 94 species of medicinal plants distributed in 84 genera and 46 families (Table 1).

T: Timber; H: herb; F: Forest; R: Ruderal; Bak: Bakoko; Bam: Bamiléké; Ban: Banen; Bassa, Bas: Bass: Bassolo; Bay: Baya; Bet: Béti; Dib: Dibom; Dou: Douala, Hao: Hauossa; Ngu: Ngumba.

Two ethnic groups emerge clearly from these histograms: the major group that has cited a large number of species ($/>15$ species) and the minor group after quoting a few species ($/<15$). The major group includes the Bamiléké (52 species, 268 number of citations), Bassa (36, 80), Beti (37, 57), Haoussa (31, 43), Douala (27, 39) and Bakoko (15, 15) while the minor group includes Bassolo (6, 6), Ngumba (4, 5), Dibom (3, 3), Baya (3, 3) and Banen (2, 2).

Related diseases of digestive tract and kidneys are more important in all ethnic groups. The majority of medicinal plants cited by each ethnic group were herbs and ruderal plant species while leaf was the most frequently used part in the preparation of remedies.

3.2 DISCUSSION

A total of 94 plant species, belonging to 84 genera, under 46 families are used in day-to-day life of the tribal people. Several species have been recorded to have more than one use. The elder ethnic people are familiarity with the plant species and their used for common ailments, and the plant remedies being used regularly. Majorities of young generation do not know many plants and their medicinal values. Only few younger are followed the medicinal practices and traditional knowledge by the elders and healers as in the case in other areas of Douala (Dibong et al., 2011a). Except some few earlier researches (Betti and Lejojo, 2000; Betti, 2002; Guedje and Fankap, 2001; Guedje, 2002; Guedje et al., 2003, 2008; Jiofack et al., 2010), these areas were unexplored ethnobotanically and ethnopharmacologically. The number of plants cited by the Bamiléké is more important because the tribe is populous. In addition, they maintaining and safeguarding of cultural and traditional values through the chiefs whose authority is established and respected in the Western Region. The consequence is that the common names of medicinal plants can be substituted by the names of the Bamiléké language without the risk of devaluation of traditional knowledge. The other major group of tribes in particular, Bassa, Béti, Douala and Bakoko benefit from their crops to enhance the development of traditional medicine. As for the Hauossa, they are few in the region although well structured chiefdoms. In addition, origin (north) is far removed from the study area, which implies relocation from their environment dominated by savannas and steppes.

The group consists of minor ethnic groups do not allow a faithful transmission of traditional knowledge and should not be considered in the emergence of traditional medicine.

The traditional knowledge of the ethnic communities in Douala town has tremendous ethnobotanical and ethnopharmacological importance. They use plants and their parts such as roots, rhizomes, tubers, leaves, steam, wood, bark, flowers, seeds, and fruits in various purposes in their daily life (Dibong et al., 2011b, 2011c, 2011d; Din et al., 2011). The high usage of herbs among the households could be an indication of their abundance as it was witnessed during visits to the study sites that areas very close to houses were well covered with herbs. The study area remains humid for most months of the year creating a favorable condition for growth of herbs. It is evident from the present study that the tribal communities are dependent on a variety of plants to meet their requirements and beliefs to cure many diseases. The different plant parts are used for medicinal preparation, mode of administration, dosage and other human consumption. In some cases, the whole plant parts are utilized only for medicinal purposes. The plant parts are generally used by the ethnic communities to cure some important diseases. The study revealed that most remedies were prepared and administrated at a household level, which is in agreement to finding to other works (Dibong et al., 2011c; Din et al., 2011). When deemed necessary, people could seek

the help to knowledgeable people in their respective locality with no or nominal charge. The majority of household informants reported that they kept their medicinal plant knowledge secret. They further revealed that free transfer of knowledge could only take place along the family line, usually from parents to sons (Dibong et al., 2011c). It was found out that transfer of knowledge to people outside the family circle could only take place substantial payment. The secrecy of traditional medicinal practice is also a common phenomenon elsewhere in the country (Betti, 2002; Guedje et al., 2008; Jiofack et al., 2010).

4. CONCLUSION

This study identified 94 medicinal plants treating 140 ailments between different ethnic communities in Douala. It is necessary to conduct thorough investigations to each ethnic community to capitalize on the cultural handed down from generation to generation. Future scope of research concern also phytochemical and phytopharmaceutical screenings.
